ocr框选错位问题

返回资源的接口：QueryNoteResourceService

主要思路是返回coverImageOcrInfo里面的wordPosition的width和hight

在coverImageOcrInfo里面新增了两个字段width和height

两个值的获取方式如下

```java
List<ImageSizeInfo> noteImageSizeMap = noteImageOcrService.getNoteImageSizeMap(noteId, historyId, url);
        if (!CollectionUtils.isEmpty(noteImageSizeMap)) {
            Double height = null;
            Double width = null;
            for (ImageSizeInfo info : noteImageSizeMap) {
                if (StringUtils.equalsIgnoreCase(info.getInfo(), "height")) {
                    height = info.getScore();
                    noteImageOcrInfo.setHeight(height);
                }
                if (StringUtils.equalsIgnoreCase(info.getInfo(), "width")) {
                    width = info.getScore();
                    noteImageOcrInfo.setWidth(width);
                }
                if (height != null && width != null) {
                    break; // 已经都填充完，提前退出
                }
            }
        }
```
